Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

strand cDNA was primed with oligo(dT)17 on 50 ng of
DNAse-treated, total cellular RNA obtained from 5,000-10
,000 microdissected, histologically normal prostate
epithelial cells. Double-stranded cDNA was ligated to
EcoRI adaptors, 5 cycles of PCR applied to the cDNA with
an adaptor-specific primer, and the resulting PCR product
subcloned into pAMPIO by the UDG-cloning method (Life
Technologies). Average insert size is 600 bp. NOTE: Not
directionally cloned. This library was constructed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

strand cDNA was primed with oligo(dT)17 on 50 ng of
strand cDNA was primed with oligo(dT)17 on 50 ng of
bNAse-treated, total cellular RNA obtained from 5,000-10
,000 microfaissected, histologically normal prostate
epithelial cells. Double-stranded cDNA was ligated to
EcoRI adaptors, 5 cycles of PCR applied to the cDNA with
an adaptor-specific primer, and the resulting PCR product
subcloned into pAMPIO by the UDG-cloning method (Life
Technologies). Average insert size is 600 bp. NOTE: Not
directionally cloned. This library was constructed by
David Krizman."

Patent No. US20020110832a1

GENERAL INFORMATION:
APPLICANT: With
APPLICANT: With
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE THERAPY
TITLE OF INVENTION: ADD DIAGNOSIS OF COLÓN CANCER
TITLE OF INVENTION: AND DIAGNOSIS OF COLÓN CANCER
TITLE OF INVENTION: AND DIAGNOSIS OF COLÓN CANCER
FILE REFERENCE: 2010.12.55

CURRENT APPLICANTON NUMBER: US/09/919,580

CURRENT FILING DATE: 2001-07-30

NUMBER OF SEQ ID NOS 934

SEQ ID NO 72

SEQ ID NO 72

Sequence 603, Application US/09925300

Patent No. US20020151681A1

GENERAL INFORMATION:

APPLICANT: Craig Rosen,

APPLICANT: Steve Ruben

TITLE OF INVENTION: Nucleic Acids, Proteins and Antibodies

FILE REFERENCE: PAIO.

CURRENT APPLICATION NUMBER: US/09/925,300

CURRENT FILING DATE: 2001-08-10

PRIOR PRILING DATE: 2000-03-08

PRIOR PELING DATE: 1999-03-12

NUMBER OF SEQ ID NOS: 1890

SOFTWARE: PATENTION NUMBER: 60/124,270

PRIOR FILING DATE: 1999-03-12

NUMBER OF SEQ ID NOS: 1890

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The patent discloses immunogenic peptides of prostate-specific antigen (PSA) and nucleic acids encoding them. The peptides of the invention are used to prepare a medicament to elicit an immune response in an animal. They are used to treat cancer such as prostate cancer and tumour metastasis. They are also useful for prophylaxis, for preparing monoclonal or polyclonal antibodies, and in conventional techniques of immunology, molecular biology, cell biology and recombinant DNA technology. The present sequence is a DNA encoding PSA derived peptide, CLP313.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC comprises administering to the patient a therapeutic amount of a CC comprises administering to the patient a therapeutic amount of a CC composition comprising an antisense oligonucleotide which selectively pridises to prostate specific antigen (PSA) gene or mRNA or to a CC probasin gene or mRNA sequence of the patient, where the antisense CC oligonucleotide inhibits expression of the sequence. The present conjugate of the patient, where the antisense CC sequence represents a specifically claimed antisense oligonucleotide against prostatic specific antigen. The antisense oligonucleotide can be used to effectively inhibit the growth of (and for the killing of) CC hyperplastic cells or cancerous cells or prostatic origin. Expression of the PSA and probasin genes is specific to prostatic cells so that the CC antisense oligonucleotide can be administered systemically, making it particularly useful in late stage prostatic cancer which has metasers and in which the cells have become resistant to oestrogen coranti-androgen therapy. The method can also be used in benign prostate hyperplasia, or early stage prostatic cancer, as an alternative for the correct radical procedures currently used, such as transurethral resection, coradical prostatectomy, or physical or chemical castration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

AAT35293-T35295 represent amplification primers for the prostate specific antigen (PSA). These primers were used to insert the CDNA for PSA into a BamHI-NotI-cleaved pVL1939 baculovirus transfer vector. The vector that was produced is ATCC VR-2496. The rPSA can produced by the vector can be used as an immunoassay calibrator. The immunoassays that use the rPSA are for the quantitative determination of PSA in a biological sample. In the assay, the test sample is combined with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 27 BP; 9 A; 7 C; 9 G; 2 T; 0 other;

cc (sub)transcriptome comprises messenger RNAs that populate a (sub)transcriptome, where the CC (sub)transcription units that populate a genome. The library comprises cCC several oligonucleotides, each capable of hybridising selectively to a Set of messenger RNAs transcribed from multiple CC the genome, which encodes one or more messenger RNA splice variants. The oligonucleotide libraries are useful for detecting mRNAs from a given transcription unit of CC quantitatively characterising the corresponding transcriptome, and in CC detecting RNA transcripts and splice variants of human or animal CC transcriptomes. The libraries may also be used as specialised mini CC libraries to detect transcripts of a sub-transcriptome under a CC particular biological or pathological state, and so allowing the CC condition; to detect developmental specific genes such as those genes conly expressed in specific tissue under a specific pathological CC transcripts and splice variants of a transcriptome under a specific so pathological state, and so allowing the CC condition; to detect developmental specific genes such as those genes conjugated and specific tissue under a specific pathological CC transcripts and splice variants of a transcriptome of a patient suffering CC transcripts and splice variants of a transcriptome of a patient suffering conjugated to detect developmental specific pathological conjugated to detect developmental specific pathological conjugated to detect developmental specific pathological conjugated to detect suffering conjugated to the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT ABN3601:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                  analyte can be detected by analysing the diffiraction pattern of the transmitted light. The method of the present invention may used to detect and quantify a variety of analytes, e.g. midroparanisms, viruses, nucleic acids, hormones, steroids, antibodies, drugg, metals and antigens, either for clinical diagnosis of infections, cancer and allergies or for detecting microbial contamination of garments, The present sequence is a synthetic oligonucleotide, which was used, as an analyte to illustrate the
                                                                                                                             The present invention relates to a method for detecting and quantifying the presence or amount of an analyte within a medium. The method comprises micro-contact printing of analyte specific receptors onto polymer film. The target analyte binds to the polymer film, and results in light diffraction when light is transmitted through the film. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                \rm N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                  infections and cancer, comprises reacting analyte with diffraction-enhancing material carrying specific receptor
                                                                                                                                                                                                                                                           Diffraction-based analyte detection, useful for clinical diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Optical diffra contamination;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAA63192 standard;

                                           The invention provides a method of determining prostate specific antigen (pPSA) in a sample which involves determining the amount of complex formed on treating a sample with a pPSA specific antibody. The method is useful for detecting prostate cancer and distinguishing it from benign prostatic disease. The present sequence represents a DNA encoding a partial fragment of the PSA.
                                                                                                                                                   Determining prostate specific antibody (pPSA), comprises determining the amount of complex formed on treating a sample with a pPSA specific antibody, useful for detecting prostate cancer and distinguishing it from benign prostatic disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                      mat_peptide

cDNA sequences AAT92974-77 encode the prostate specific antigen (PSA). The detection of PSA mRNA in peripheral blood is associated with metastatic prostate cancer. Detection of PSA mRNA in the bloodstream indicates that prostate cells are circulating in the blood and confirms diagnosis of cancer. Circulating prostate cells also indicate a risk of a secondary tumour or bone metastatic anchoring. Detection of the PSA mRNA after prostatectomy or radiotherapy indicates a risk that the prostate cancer has spread and that the surgery and radiotherapy was not effective. PCR primers AAT92971-73 were used for the monitoring and diagnosis of patients with prostate cancer. The method comprises the detection of PSA mRNA by reverse transcriptase polymerase chain reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Diagnosis; prostate cancer; prostate specific antigen; PSA; metastatic prostate cancer; prostate cell; secondary tumour; bone metastatic anchoring; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Monitoring or diagnosis of prostate cancer - by detecting prostate-specific antigen mRNA using specific primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cDNA for prostate specific antigen (PSA).

                                                                                                                                                                                                                                                              AAT35293-T35295 represent amplification primers for the prostate specific antigen (PSA). These primers were used to insert the cDNA for PSA into a BamHI-NotI-cleaved pVLI393 baculovirus transfer vector. The vector that was produced is ATCC VR-2496. The rPSA can produced by the vector can be used as an immunoassay calibrator. The immunoassays that use the rPSA are for the quantitative determination of PSA in a biological sample. In the assay, the test sample is combined with a labelled conjugate and the response of the conjugate is compared to a standard curve established by performing the assay on one or more calibrators using rPSA (or an immunologically reactive fragment).

(I) is useful for:

(a) assessing whether a patient is afflicted with prostate cancer;

(b) monitoring the progression of prostate cancer in a patient;

(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 308 BP; 65 A; 100 C; 79 G; 63 T; 1 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated nucleic acid molecule associated with cancerous state prostate cells and correlating with presence of prostate cancer, used for detecting presence of prostate cancer, stage of prostate cancer
                                                                                                                                                                                                                                                                                                                                                                       (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; in a patient;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; Page 7668; 11750pp; English.

Nucleic acid synthesis using primer containing a sequence identical to one on the template for isothermal amplification using simple reagents

Example 8; Fig 17; 95pp; Japanese.

CCCCXXXTT PTT PTXXX PXXX PTXXX The invention relates to a novel method of isothermal DNA amplification. A region is produced at the 3' end of a target sequence which contains sub-sequences designated F1, F2C and F1C, where F1C is the complement of F1. A loop is formed by annealing of F1 to its complementary sequence

The resent invention describes a new method for synthesising nucleic acids comprising: (a) preparing a nucleic acid, with an F2c region, able to form a loop by annealing the F1 region of the 3' end to the F1c region on the same chain; (b) synthesis of a complementary chain using the 3' end of F1 as the starting point; (c) replacing the complementary chain by annealing an oligonucleotide containing F2, (complementary to F2c) at its 3' end and using it as a starting point for complementary chain synthesis by a polymerase; and (d) replacing the chain synthesised in step c by annealing a polynucleotide containing a region complementary to a part of the chain and using it 3' end as the starting point. Also described are: (1) a kit for synthesising nucleic scacids; and (2) a kit for detecting target base sequences. The present sequence represents a prostate specific antigen related nucleotide sequence, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

The invention also encompasses primers for the method of the invention, and methods for the detection of a nucleic acid sequence in a sample using a labeled probe containing a sequence complementary to the loop region of the target sequence. The method of the invention provides an efficient and highly specific method for isothermal amplification of a target nucleic acid sequence using a simple reagent mixture. The present sequence represents a prostate specific antigen (PSA)
                                                                                                                                                                                                                                                                                                                                                                                                                           Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Synthesizing

                                                                                                                                                                    The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate
                                                                                                                                                                                                                                                                                                                                                                                                                         16-MAR-2000;

                                                                                                                                                    The invention relates to a method of immunization against prostatic cancer (PC) by administering a nucleic acid (this sequence) that encodes prostate-specific antigen (PSA), or its immunologically active fragment, cells and then expressed to generate an immune response against PSA. The method is used to protect against, or treat, PC, or more generally to induce a cellular immune response to PSA.

Site_1: SfiI (ggccgctcggcc); Site_2: SfiI (ggccattatggcc);
5' and 3' adaptors were used in cloning as follows: 5'
adaptor sequence: 5'-CACGGCCATTATGGCC-3' and 3' adaptor
sequence: 5'-ATTCTACAGGCCAGCGGCCACATG-dT(30)BN-3'
(where B = A, C, or G and N = A, C, G, or T). Average
insert size 1.4 kb (range 0.5-4.0 kb). 14/15 colonies
contained inserts by PCR. This library was enriched for
full-length clones and was constructed by Clontech
Laboratories (Palo Alto, CA)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note="vector: pAMP10; Site_1: Not1; Site_2: EcoRI; 1st strand cDNA was primed with oligo(GT)]7 on 50 mg of DNAse-treated, total cellular RNA obtained from 5,000-10,000 microdissected cellular RNA obtained from 5,000-10,000 microdissected cells histologically-determined to be fully malignant prostate cancer cells. Double-stranded cDNA was ligated to EcoRI adaptors, 5 cycles of PCR applied to the cDNA with an adaptor specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by David Krizman."
